A Message from the County Executive...

June 2006

Greetings,

Each year I take great pride in bringing you the annual Drinking Water Quality Report. This report is a reflection of the hard work and dedication of our 68 Water Operations employees who each year make it their mission to bring to you the best, safest, healthiest drinking water possible. Once again the drinking water of Anne Arundel County is of a quality higher than standards set by federal and state regulations. This is so important when you consider the vital place that water plays in everyday life. Our planning through the years has resulted in the infrastructure needed to take the water from source to treatment to our customers. Each year additional Capital Projects are built as we continue to improve the system for the future. I hope you take a few minutes to read this very important report. I also encourage you to practice water conservation. Although we are blessed with adequate supplies, it is our legacy to future generations to ensure these water supplies continue to be available.

Sincerely,

County Executive

Anne Arundel County Department of Public Works

2005 DRINKING WATER QUALITY REPORT

Your drinking water is a vital resource. Anne Arundel County takes your drinking water very seriously. The Department of Public Works, Bureau of Utility Operations has 68 dedicated, trained professionals working around the clock to provide you with water that is superior to state and federal water quality standards.

In 2005, the drinking water provided by Anne Arundel County met all health and safety regulations. This report contains information about the sources, treatment and delivery of your drinking water, as well as the results of numerous tests performed throughout the year. We encourage you to take the time to read this report to learn more about the quality of your drinking water.

The water treated and distributed by the County is continually monitored. Water is tested by the County's state certified laboratory, the State of Maryland and in some cases private laboratories. The results of the analyses, performed throughout the year for both regulated and unregulated contaminants, are included in this report.

2005 Monitoring for Quality

- approximately 22,500 water quality samples collected
- approximately 38,000 analyses performed
- 130 parameters used in testing

Results: 0 violations
(Regulatory Non-compliances)

2005 Public Drinking Water Fast Facts

- 9.74 billion gallons produced
- 3.75 billion gallons purchased from Baltimore City
- 13.49 billion total gallons distributed by Anne Arundel County
- 1,200 miles water mains
- 16 water treatment plants
- 106,700 direct billed customers
- 400,000 estimated consumers

The County's public water system is divided into 8 water service areas as illustrated in the map in this report. All of the service areas receive drinking water produced at County water treatment facilities. Two of the service areas also receive drinking water that is purchased by the County from Baltimore City. The City facilities use surface water from reservoirs as a supply source. The County facilities use ground water from wells as a supply source.

Water produced in the County is taken from deep wells (150 to over 1000 feet deep) in the Patapsco, Patuxent and Aquia aquifers. Ground water flows from recharge areas, where water flows into the ground to resupply a water source, into the aquifers, through which water travels at a slow rate to the area where the wells are located.

Groundwater treated by the County typically goes through the following processes: aeration for oxidation of iron; chlorine addition for disinfection; lime addition for pH adjustment; sedimentation and filtration for iron and particle removal; and fluoride addition to prevent dental decay. Treated water enters the "distribution" system which consists of about 1,200 miles of water mains which deliver the water directly to customers.

2005 System Improvements...

Every year, through the Capital Improvement Program, the County manages projects designed to improve drinking water by responding to and anticipating future growth, as well as preventing the deterioration of the County's existing system. Current projects include a series of water transmission mains on the east and west sides of the County. These projects will eventually provide the means to transport large quantities of drinking water from Arnold and Crofton Meadows Water Treatment Plants throughout the east and west sides of the County, respectively, as well as parts of northern Anne Arundel County. In addition, the County is planning to expand these two water treatment plants to meet future needs. Other ongoing projects provide cleaning and lining of existing distribution pipes, rehabilitation of water services, valves, fire hydrants and other parts of the water distribution system.

Information on your water system...

In addition to this annual report, information about your water system is provided in Customer Updates, which are included in your utility bill, as well as comprehensive information on the Department of Public Works' web site at www.aacounty.org/dpw. Other informational materials are available from Public Works' Customer Relations staff at 410-222-7582. Most printed informational materials are available under the Customer Relations section of the web site. In addition, all capital projects which include improvements and/or additions to the water supply system are included in the annual budget presented by the County Executive to the County Council each spring.

A Leader in the Drinking Water Community

by active membership in:

***Association of Metropolitan Water Agencies (AMWA)** works with large publicly owned drinking water systems that provide clean, safe drinking water to more than 110 million Americans. AMWA works with Congress and federal agencies to help ensure safe and cost-effective federal drinking water laws and regulations.

***American Water Works Association (AWWA)** is a clearing-house for information and expertise and an advocate for large water suppliers for public health and water quality issues. With its broad based knowledge and proven experience, AWWA, with its 56,000 members, acts as an advocate and voice for the drinking water community.

***American Water Works Association Research Foundation (AWWARF)** is an international non-profit research organization whose mission is to enable water utilities and other professionals to provide safe and affordable drinking water to consumers.

Public hearings are held throughout the County and public comment is welcome. The County also maintains a "Ten Year Master Plan for Water Supply and Sewage Systems." The County Budget and Master Plan can be reviewed at any branch of the County library. For information on the Master Plan, contact the Long Range Planning Section, Office of Planning and Zoning at 410-222-7432.

Typical Water Treatment Processes

Learn more about...

Radium...

Radium is a naturally occurring substance which, if exposed to acidic conditions (low pH), can leach into groundwater. The EPA has set maximum contaminant levels for radium that are based on lifetime exposure. The County and State monitor the public water system. All results were within the acceptable limits set by EPA. Some people who drink water containing combined radium in excess of the MCL over many years, may have an increased risk of getting cancer. However, the risk is very small.

Radon...

Radon is a naturally occurring radioactive gas that may cause cancer, and may be found in drinking water and indoor air. The EPA advises that some people who are exposed to radon in drinking water may have increased risk of cancer over the course of their lifetime, especially lung cancer. Radon in soil under homes is the biggest source of radon in indoor air, and a greater risk of lung cancer than radon in drinking water. For more information, call EPA's Radon Hotline (800-SOS-RADON) or visit the web site at www.epa.gov/radon. Testing has indicated that radon is not present in the public water system at concentrations which would cause any health concerns.

Cryptosporidium...

Cryptosporidium is a microscopic parasite that may cause diarrhea, fever and related gastroenteric disorders in infected humans and animals. Cryptosporidium may find its way into drinking water that comes from surface water, such as reservoirs, rivers or lakes. Cryptosporidium is not a problem in drinking water taken from aquifers via deep wells. Since the source of drinking water from Baltimore City is reservoirs, the City monitors its raw water sources for cryptosporidium. Samples from the raw water sources were analyzed and determined to be free of viable organisms. The City protects its water supply reservoirs to help prevent these organisms from entering the water supply.

Arsenic...

Arsenic is a naturally occurring substance which, if contained in drinking water, could increase the risk of serious health concerns such as circulatory problems. The EPA level for this contaminant is 10 ppb. Testing has indicated that there is no arsenic in the public water system.

Lead...

The source of lead in drinking water is normally from leaching in individual home plumbing systems and not from source water, water treatment processes, or the water distribution system. Testing has indicated that lead is not present in the public water system at concentrations which would cause any health concerns.

Source Water Assessment...

Source Water Assessment is a process for evaluating the vulnerability to contamination of the source of a public drinking water supply. The assessment does not address the treatment process, or the storage and distribution aspects of the water system, which are covered under separate provisions of the Safe Drinking Water Act. The Maryland Department of the Environment is the lead agency in developing these Assessments. Source Water Assessments are in progress but have not yet been completed for all of the County's water systems.

Information from the EPA...

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at (800) 426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from waste treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm runoff, industrial or domestic discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

Notes for Data Table

Note 1: The "MCL" and "MCLG" for Total Coliforms is based on the percentage of "positive coliform results" in a given month. The MCL requires that less than or equal to 5% of the samples test positive. The percentage of positive sample results is shown in the "range of detection" column.

Note 2: Turbidity standards are based on a "treatment technique" and are only applicable to systems using surface water as a source. The maximum Turbidity allowed in a given month is 1 NTU, and 95% of the results must be less than 0.3 NTU. This % is indicated in the "range of detection" column.

Note 3: Compliance with the MCL for these contaminants is based on the average of four quarterly samples. The "range of detection" numbers represent individual analysis results, not an average. There were no MCL violations at any facility.

Note 4: Compliance with the MCL for Lead and Copper is based on the "90th percentile" value of all analysis results. The number of sample results exceeding the MCL for these parameters is indicated in the "range of detection" column.

Note 5: Testing for some parameters is not required on an annual basis. Some results reflect the most recent testing between 2003 - 2005.

Note 6: Testing required by EPA to determine if an MCL/health standard should be set.

Note 7: EPA considers a level of 50 pCi/l equivalent to the actual MCL of 4 mrems/l.

General Note: The drinking water was analyzed for more than 110 other parameters. These contaminants do not appear in the data table because they were not detected.

Definitions of Terms Used in Water Quality Data Table

Maximum Contaminant Level Goal (MCLG) - level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL) - highest level of a contaminant allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology.

Action Level - concentration of a contaminant which, if exceeded, triggers a treatment or other requirement which a water system must follow.

N/A - not applicable

ND - not detectable at testing limit

NT - not tested

ppm - parts per million or milligrams per liter. One part per million is the equivalent of 1 cent in \$10,000 or one minute in two years.

ppb - parts per billion or micrograms per liter. One part per billion is the equivalent of 1 cent in \$10,000,000 or one minute in two thousand years.

pCi/l - picocuries per liter (a measure of radiation)

mrems/l - millirems per liter (a measure of radiation)

NTU - nephelometric turbidity units (a measure of clarity)

TT - treatment technique, a required process intended to reduce the level of a contaminant in drinking water
